

Patient Friendly Lab Report

Based on the lab report, it appears that there are some abnormalities in your blood test results. Specifically, several tests showed values outside of the normal range. One area of concern is your red blood cell count, which is higher than normal. This could be a sign of an underlying condition or medication side effect. Additionally, your mean corpuscular hemoglobin and volume are lower than normal, which may indicate a deficiency in these areas. Your blood sugar levels are also higher than normal, which could be related to diabetes or other metabolic issues. Furthermore, your zinc and iron levels are low, which may impact your overall health and energy levels. There is also some concern about your urinary tract health, as the number of white blood cells in your urine is higher than normal. This could indicate an infection or inflammation. Finally, there are some abnormalities in your cholesterol levels and creatinine levels, which may require further evaluation. It's important to consult with your doctor to discuss these findings and determine the best course of action. They will be able to review your complete medical history and provide personalized guidance on how to address
