

Patient Friendly Lab Report

Based on the lab report, it appears that there are some abnormalities in your blood test results. One of the main findings is that your mean corpuscular hemoglobin (MCH) and mean corpuscular volume (MCV) are lower than normal. This could indicate a potential issue with your red blood cells. Additionally, your total RBC count is higher than normal, which may suggest an increase in red blood cell production. Your average blood glucose level is also higher than normal, indicating that your blood sugar levels may be elevated. Furthermore, your serum zinc and iron levels are lower than normal, which could indicate a deficiency in these essential nutrients. Your urinary leucocytes (pus cells) count is also higher than normal, suggesting an increase in white blood cell production. Finally, your creatinine level is lower than normal, which could indicate a decrease in kidney function. It's important to note that these findings are not necessarily indicative of any specific disease or condition, and further testing may be needed to determine the underlying cause. I would recommend consulting with your doctor to discuss these results and determine the next
