

## Patient Friendly Lab Report

Based on the lab results, it appears that your body is doing a good job of keeping your blood sugar levels under control. The report shows that your hemoglobin A1c level is within a healthy range, which means that your average blood sugar levels over the past few months have been well-managed. Additionally, the test results indicate that your liver enzymes are normal, which suggests that your liver is functioning properly and not showing any signs of damage. Your kidney function also appears to be normal, which is great news for your overall health. It's also reassuring to see that your complete blood count (CBC) is within a healthy range, indicating that your body is producing the right number of red and white blood cells. This suggests that your immune system is functioning properly and can help fight off infections when needed. Overall, these lab results suggest that your body is working well and that you're in good health. However, it's always important to consult with your doctor to get a more complete understanding of what these test results mean for you specifically.
